DEPARTMENT OF ICT
FACULTY OF TECHNOLOGY
SOUTH EASTERN UNIVERSITY OF SRILANKA

Labsheet: 06

Date: 19.12.2023

Title: Programming Shell Scripts- IV

Aim: Getting practice to write a shell script for Conditional Execution (Decision Making)

Tasks:

- Working with logical statements in shell script
- Working with case statement in shell script

Exercise 01: Logical Operators

Operator	Meaning
(Exp1 && Exp2) or (Exp1 -a Exp2)	Logical AND
(Exp1 Exp2) or (Exp1 -o Exp2)	Logical OR
! Expression	Logical NOT

1. Check if the number is within a specific Range
2. Write a shell script to find the greatest of three numbers.
 - Get three numbers. Say num1, num2 and num3
 - (num1 > num2) and (num1 > num3) – num1 is greater
 - (num2 > num1) and (num2 > num3) – num2 is greater
 - (num3 > num1) and (num3 > num2) – num3 is greater
3. The marks obtained by a student in five different subjects are input through a keyboard. The student gets a division as per the following rules:
 - Average above or equal to 90 – First division
 - Average between 60 and 89 – Second Upper division
 - Average between 40 and 59 – Second Lower division
 - Average less than 39 – Fail

Write a shell script program to determine the division obtained by the student.

Exercise2: Case statement

Syntax:

```
case EXPRESSION in
    Pattern_Case_1)
        STATEMENTS ;;

    Pattern_Case_2)
        STATEMENTS;;

    Pattern_Case_N)
        STATEMENTS ;;
*)
    STATEMENTS
;;
esac
```

1. The system will ask user to input whether they are student or not. Write a shell script to prompt user with yes or no as the input from the user.
2. Write a bash script that prompts the user to enter a month and outputs the number of days. There are three possible answers:
 - I. 31 days
 - II. 30 days
 - III. 28 or 29 days.

3. Write a bash script that will perform the following tasks

Display the following options list to prompt the user to enter the list.

- a. Registration
- b. File Operations 1
- c. File Operation 2
- d. Exit

Prompt the user to enter his option and store it into a variable called "Option".

- When the user selects Option a,
The system should request the user to enter
 - Registration Number
 - Password
 - Confirm Password

Check whether the Password and Confirm Password are matching with each other

- If those are matching, then display a message "Passwords Match. "
 - If those are not matching, then display a message "Passwords do not Match. and prompt the user to re-enter the confirm password
- When the user selects Option b,
 - Show hidden files.
 - List all text files and .sh files in the current directory.
 - When the user selects option c,
 - Create a directory with a name of Lab6
 - Inside a directory, create a file with the name of test1
 - When the user selects option d,
 - Exit from running the script.
 - When a user enters any other values, display the message, "Invalid option! Try again"
