Title: Programming Shell Scripts- VI

Aim: Getting practice to write and execute functions in shell scripts

Tasks:

- Create a function in shell script
- Function with return command in shell script
- Passing parameters to function in shell script
- Variable scope in a function
- Recursive function in shell script

Function Syntax:

```
function_name () {  
  
list of commands  
  
}
```

Exercise1: Create function

1. Create a function with function_name, ***Hello()*** and display “Hello world”.

Exercise2: Passing Arguments / Parameters

1. Write a shell script to obtain the output as shown in the output screen bellow. Supply the argument to the function ***Arguments()*** that you create.

```
Hello everyone  
Hello XXX
```

2. Write a shell script to obtain the output as shown in the output screen bellow. Supply the argument to the function ***Arguments()*** that you create.

```
The number of arguments passed: 2
The first argument is: apple
The second argument is: banana
```

Exercise3: Return Value

1. Write a shell script to return an integer from the function Add_Val():
Prompt the user to enter a number.
Add value 20 to the number you entered.
Print the final value.

Exercise4: Variable scope

1. Write a shell script to demonstrate the variable scope in bash.
 - b) Start the script by defining two global variables as var1 and var2 and assign values 'A', 'B' respectively.
 - c) Then create the function *variable_scope()*
 - d) Within the function;
 - i. Modify the global variable var1 as 'C'
 - ii. Set var1 as local variable and assign 'D' to it.
 - iii. Also modify the global variable var2 as 'E'.
 - e) By running the script your output should be as follows:

```
Before function call:
var1: A
var2: B
Inside function:
var1: D
var2: E
After function call:
var1: C
var2: E
```
